As we bid you a fond farewell, we will wish to send you off with some parting thoughts about **best practices**. Here are thoughts about things to remember when designing or building embedded systems, in no particular order of importance:

- Consider debugging when defining, designing, implementing, building and deploying.
- Careful thought during design can save lots of time during implementation and debugging.
- Choose good variable names so the software is easier to understand.
- Divide large projects into modules and test each module separately.
- Separate hardware from software bugs by first testing the software on a simulator.
- When designing modules start with the interfaces, e.g., the header files.
- The second step when designing modules is pseudo code typed in as comments.
- Make the time to service an interrupt short compared to the time between interrupts.
- When developing a modular system, try not to change the header files.
- Use a consistent coding style so all your software is easy to read, change, and debug.
- Most of your time is spent changing or fixing existing code called **maintenance**.
- So, when designing code plan for testing and make it easy to change.
- Writing friendly code makes it easier to combine components into systems.
- Use quality connectors, because faulty connectors can be a difficult flaw to detect.
- It is your responsibility to debug your hardware and software.
- It is also your responsibility to debug other hardware/software you put into your system.
- A simple solution is often more powerful than a complex solution.
- Listen carefully to your customer so you can understand their needs.
- Draw wiring diagrams of electrical circuits before building.
- Double-check all the wiring before turning on the power.
- Double-check all signals in cables, don't assume red is power and black is ground.
- Be courageous enough to show your work to others.
- Be humble enough to allow others to show you how your system could be better.

EdX is a non-profit created by founding partners Harvard and MIT whose mission is to bring the best of higher education to students of all ages anywhere in the world, wherever there is Internet access. EdX's free online MOOCs are interactive and subjects include computer science, public health, and artificial intelligence.
