Just like decimal and binary, each hexadecimal digit has a place and a value. In this case, the place is a power of 16 and the value is selected from the set {0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F}.

A hexadecimal number (often abbreviated as "hex" is a combination of its digits multiplied by powers of 16. To eliminate confusion between various formats, we will put a 0x or a \$ before the number to mean hexadecimal.

A **nibble** is defined as 4 binary bits, or one hexadecimal digit. Each value of the 4-bit nibble is mapped into a unique hex digit, as shown in Table 2.1.

Help

TABLE 2.1

Hex Digit	Decimal Value	Binary Value
0	0	0000
1	1	0001
2	2	0010
3	3	0011
4	4	0100
5	5	0101
6	6	0110
7	7	0111
8	8	1000
9	9	1001
A or a	10	1010
B or b	11	1011
C or c	12	1100

D or d	13	1101
E or e	14	1110
F or f	15	1111

As illustrated in Figure 2.1, to convert from binary to hexadecimal we can:

- 1) Divide the binary number into right justified nibbles,
- 2) Convert each nibble into its corresponding hexadecimal digit.

Figure 2.1

Help

As illustrated in Figure 2.2, to convert from hexadecimal to binary we can:

- 1) Convert each hexadecimal digit into its corresponding 4-bit binary nibble,
- 2) Combine the nibbles into a single binary number.

Figure 2.2
